

Sehat Saathi

Developer Onboarding Guide

PROJECT DETAILS

Lead Developer	Nawaneet Kumar
Email	Nawaneet.Kumar@ril.com
Branch	vertical/health
Prepared by	Akshay Borhade
Repository	akshayborade09/intelligence-core

1. Overview

Sehat Saathi is a Hindi-language AI health companion — part of the JioBharatIQ Intelligence Core platform built by Reliance Jio. It runs as a standalone Next.js app inside a Turborepo monorepo. Your role as Health Lead is to build and maintain all features inside the **apps/health/** directory and push them to the **vertical/health** branch.

Project At a Glance	
Platform	Next.js 16 + React 19 + Tailwind v4
Monorepo	Turborepo — apps/health is your workspace
Your branch	<code>vertical/health</code>
Dev port	<code>http://localhost:3004</code>
Shell (full app)	<code>http://localhost:3000</code> — tap Health to enter your app
AI models	Groq llama-3.3-70b (primary) · OpenAI gpt-4o-mini (fallback)
Voice	Sarvam AI — Hindi STT (Saarika) + TTS (Bulbul)
Screens	15 screens: chat, hub, onboarding, medicine, meal, family, lab, breathwork, and more

2. GitHub Access

You have been added as a collaborator with **Write** access to the repository. This means you can clone the full codebase and see all verticals, but you can only push to your assigned branch: **vertical/health**. Other branches are protected at the server level — git will reject any push outside your lane.

Step 1 — Accept the invite

Check your email for an invite from GitHub, or visit **github.com/notifications** and accept the collaborator invite for **akshayborade09/intelligence-core**.

Step 2 — Clone the repo

```
git clone https://github.com/akshayborade09/intelligence-core.git
cd intelligence-core
git checkout vertical/health
```

Branch permissions

Branch Access

main	Protected — PR required to merge	Read only
vertical/health	Your branch — push freely	Read + Write
vertical/news etc.	Other leads' branches	Read only

3. Dev Setup

Prerequisites

Requirements	
Node.js	v22 or later — nodejs.org
npm	v11 or later (bundled with Node)
Git	git-scm.com — already installed if you cloned
Claude Code	<code>npm install -g @anthropic/claude-code</code>

Install dependencies

```
# From repo root – installs everything for all verticals
npm install
```

Add your API keys

The app needs API keys to enable AI chat and voice. Create a `.env.local` file inside `apps/health/` — this file is gitignored and will never be committed.

```
cd apps/health
cp .env.example .env.local

# Open .env.local and fill in your keys:
NEXT_PUBLIC_GROQ_KEY=gsk_your_groq_key_here
NEXT_PUBLIC_OPENAI_KEY=sk-proj-your_openai_key_here
NEXT_PUBLIC_SARVAM_KEY=your_sarvam_key_here
```

Note: Groq is free and fastest. The app works with just the Groq key — OpenAI and Sarvam are optional for voice features.

Run the app

```
# Option A – Run only your health app
cd apps/health && npm run dev

# Open: http://localhost:3004

# Option B – Run the full platform (all verticals + shell)
```

```
cd intelligence-core && npm run dev
```

```
# Shell: http://localhost:3000 | Health: http://localhost:3004
```

4. Your Files

You work exclusively inside `apps/health/`. Do not modify files in other apps or packages — those belong to other vertical leads or the platform team.

apps/health/ — file guide		
File	What it is	Touch?
<code>src/app/page.tsx</code>	All 15 screens as React JSX — your main file	YES
<code>src/app/globals.css</code>	All CSS — SS styles start after the Sehat Saathi comment	YES
<code>public/sehat-saathi-runtime.js</code>	App logic: navigation, AI calls, voice, state (5,400 lines)	YES
<code>.env.local</code>	Your API keys — never commit this	YES
<code>CLAUDE.md</code>	Context file Claude Code reads automatically — do not delete	OK
<code>src/app/layout.tsx</code>	Shell layout — dark theme, font, body styles	NO
<code>next.config.ts</code>	Next.js build config	NO
<code>src/globals.d.ts</code>	TypeScript declarations for runtime functions	NO

5. The 15 Screens

All screens live in `page.tsx` as `<div className="screen" id="s-xxx">` divs. CSS transform handles transitions — only the active screen is visible. Navigate between screens using the global JS functions.

All 15 screens		
Screen ID	Name	What it contains
<code>s-home</code>	Landing	5 persona assistants + quick actions grid + updates feed
<code>s-hub</code>	Sehat Hub	Score chip, stories, triage grid, daily dots
<code>s-chat</code>	AI Chat	Nushke / Symptoms / Wellness / Community modes
<code>s-onboard</code>	Onboarding	3-step profile setup: scope → details → BMI
<code>s-community</code>	Community	Peer chat with persona roleplaying

s-lab	Lab Interpreter	PDF/photo upload → AI explanation in Hindi
s-medicine	Medicine	Reminder setup: name, dose, time, days
s-meal	Meal Plan	AI-generated personalised meal plan
s-family	Parivaar	Family member profiles with health conditions
s-breathwork	Swas & Sukoon	Animated breathing exercise with timer
s-rx	Dawai Parchi	Prescription scanner + Bazaar integration
s-order	Order	Medicine order placement
s-track	Track Order	Delivery tracking
s-bazaar	Bazaar	Ayurvedic products marketplace
s-focus-qa	Focus Flow Q&A;	Symptom-guided multi-step health check

Navigation

```
// Go to a screen
goTo('s-hub')

// Go back to previous screen
goBack()

// Launch a feature (handles onboarding gate automatically)
startFeature('nushke') // chat
startFeature('medicine') // reminders
startFeature('lab') // lab interpreter
```

6. Adding a New Screen

Every screen follows the same pattern. Add yours at the bottom of `page.tsx`, just before the toast div.

Template

```
{/* ■■ MY NEW SCREEN ■■ */}

{/* Header */}

{/* back arrow SVG */}

Screen Title

{/* Scrollable body */}

{/* your content here */}
```

Link to it from another screen

```
goTo('s-myscreen'))>

Open my screen
```

Add CSS for your screen

Add styles at the bottom of **globals.css**, after the last existing rule. Use the existing CSS variable names so your screen matches the design system:

```
/* ■■ My Screen ■■ */

.my-card {
  background: var(--surface);
  border-radius: var(--radius);
  padding: 16px;
  border: 1px solid rgba(255,255,255,.08);
}
```

CSS variables reference

Design tokens

<code>--bg</code>	#0a0a0a — page background
<code>--surface</code>	#1a1a1a — card background
<code>--primary</code>	#6B21A8 — Jio purple

--text	#ffffff — primary text
--text2	#c8c8c8 — secondary text
--text3	rgba(255,255,255,.46) — muted text
--success	#22c55e — green
--warn	#fb923c — orange
--sparkle	#1eccb0 — teal accent
--radius	16px — card corner radius
--radius-pill	999px — pill/chip radius

7. Claude Code Workflow

Claude Code is a terminal-based AI coding assistant. It reads your files, writes code, runs commands, and can commit and push — all from one conversation. It is the recommended way to build Sehat Saathi features.

Install and launch

```
# Install once

npm install -g @anthropic/claude-code

# Launch from your health folder

cd intelligence-core/apps/health

claude
```

When Claude Code starts, it automatically reads **CLAUDE.md** — so it already knows your 15 screens, architecture, what files to edit, and the git rules. You do not need to explain the project every session.

Example prompts to get started

Build a new feature

```
"Add a new screen called 'Yoga' with 4 yoga pose cards and a timer. Each card should show the pose name, duration, and a start button. Wire it up to the hub quick actions grid."
```

Fix a bug

```
"The breathwork timer is not stopping when I press the stop button. Read the runtime JS and fix the stopBreath() function."
```

Improve a screen

```
"The chat screen's message bubbles look too plain. Add a subtle gradient border to the bot messages and make the user messages right-aligned."
```

Ask about the codebase

```
"How does the onboarding flow work? Explain what renderOnboardStep() does and what data it saves to localStorage."
```

Commit and push

```
"Commit everything in apps/health/ with message 'feat(health): add yoga screen' and push to vertical/health."
```

Tips for working with Claude Code

- Start every session with: "Read page.tsx to understand the current state, then..."
- For big changes, ask it to plan first: "Outline how you'll build X before writing any code"

- After it writes code, say: "Run the dev server and check for TypeScript errors"
- Always say which screen you want to change — Claude Code will read it first
- At the end of a session: "Commit and push everything to vertical/health"

8. Git Workflow

Always commit only files inside **apps/health/**. Push only to **vertical/health**. When a feature is complete, open a Pull Request targeting **main** and notify Akshay for review.

Day-to-day

```
# 1. Pull latest before you start
git pull origin vertical/health

# 2. Make your changes in apps/health/

# 3. Stage only your files
git add apps/health/

# 4. Commit with a clear message
git commit -m "feat(health): add yoga breathing screen"

# 5. Push
git push origin vertical/health
```

Commit message format

Use the format **feat(health): description**. This keeps the git log clean and lets Akshay quickly see what you changed.

Commit types		
Type	When to use	Example
feat(health):	New screen or feature	feat(health): add yoga screen
fix(health):	Bug fix	fix(health): fix breath timer stop
style(health):	CSS / visual change only	style(health): update hub card colours
refactor(health):	Code cleanup, no behaviour change	refactor(health): simplify goTo logic
content(health):	Hindi copy / text update	content(health): update nushke remedies

Opening a Pull Request

When a full feature is ready to go into the main app:

```
# Option A – via GitHub website
# Go to: github.com/akshayborade09/intelligence-core
```

```
# Click 'Compare & pull request' on the vertical/health banner

# Base: main | Compare: vertical/health

# Add a description of what you built, then create as Draft

# Option B – via terminal

gh pr create \
  --title "feat(health): [your feature name]" \
  --body "## What I built\n- ..." \
  --base main \
  --head vertical/health \
  --draft
```

After creating the PR, message Akshay on Slack or email akshay1.borhade@ril.com with the PR link. He will review and merge.

9. Do's and Don'ts

Do	Don't
✓ Work only inside apps/health/ — every file you need is here	✗ Do NOT commit .env.local — your API keys must never go to GitHub
✓ Push to vertical/health after every working feature or fix	✗ Do NOT push to main, vertical/news, vertical/astro, or any other branch
✓ Commit small and often — one feature per commit is ideal	✗ Do NOT modify src/app/layout.tsx — it controls the dark theme setup
✓ Keep all user-facing text in Hindi (Devanagari or Hinglish)	✗ Do NOT modify src/globals.d.ts — it is auto-generated
✓ Use Claude Code for big changes — it reads context before writing	✗ Do NOT install new npm packages without checking with Akshay first
✓ Add .env.local to store API keys — it is already gitignored	✗ Do NOT hardcode API keys anywhere in page.tsx or runtime.js
✓ Pull from vertical/health at the start of each session	✗ Do NOT translate Hindi content to English — keep it in Hindi
✓ Ask Akshay before touching shared packages/ or apps/shell/	✗ Do NOT run git reset --hard or force push — always use git revert

10. Quick Reference

Key commands

```
# Start health app only
cd intelligence-core/apps/health && npm run dev

# Start full platform
cd intelligence-core && npm run dev

# Launch Claude Code
cd intelligence-core/apps/health && claude

# Commit and push
git add apps/health/
git commit -m "feat(health): what I built"
git push origin vertical/health

# Pull latest from your branch
git pull origin vertical/health

# Check what files changed
git status
git diff
```

Key URLs

Reference URLs	
Your app (dev)	http://localhost:3004
Full shell (dev)	http://localhost:3000
GitHub repo	github.com/akshayborade09/intelligence-core
Groq (free AI key)	console.groq.com
OpenAI key	platform.openai.com/api-keys
Sarvam key (voice)	dashboard.sarvam.ai

Contact

Contacts	
Platform Lead (Akshay)	akshay1.borhade@ril.com

Your email	Nawaneet.Kumar@ril.com
For PR reviews	Message Akshay on Slack or email with the GitHub PR link
For access issues	Message Akshay — he manages GitHub collaborator access

You have everything you need. Clone the repo, run the app, open Claude Code, and start building. Push to vertical/health after every feature.

— Akshay Borhade, Intelligence Core Platform Lead
